Introduction

1.1 Overview

Verizon provides Electronic Data Interchange (EDI) and Electronic Funds Transfer capabilities for telephone billing invoices. Verizon uses the Consolidated Services Invoice/Statement, 811 Transaction Set as developed by ASC (Accredited Standards Committee) X12 with the assistance of the Alliance for Telecommunications Industry Solutions (ATIS)-sponsored Ordering and Billing Forum (OBF) EDI Telecommunications Billing (ETB) which was formerly called TCIF.

Verizon is a member of OBF. This customer guide adheres wherever possible to the EDI Guidelines as set forth by that organization. However, it may be necessary to deviate from those guidelines in order to present specific charges. Verizon will continue to work with the EDI Telecommunications Billing (ETB) committee to provide an industry-consistent version of the 811 Transaction Set.

1.2 Purpose of Guide

This document, the Verizon EDI Billing Implementation Guide, provides an overview of Verizon' EDI billing processes. It serves as a "guide" in assisting trading partners with implementation and operation of the 811 Telephone Billing Transaction Set with Verizon.

The EDI 811 is available at no additional charge to customers. The EDI 811 files are delivered as an electronic transmission. The official copy of the invoice remains the paper invoice and/or the PDF version available to you via the Verizon Enterprise Center

The purpose of this guide is to provide trading partners with a standardized definition of the information Verizon provides on the 811 Telephone Bill.

It is intended to serve as a means of achieving consistency in implementation as well as in documenting the EDI capabilities of Verizon's telephone billing systems. This EDI Billing Implementation Guide is specific to Verizon use of the 811 Transaction Set and provides information about the structure and values associated with a Verizon bills.

Verizon has many billing systems. We provide one EDI 811 format/structure for these bills. However, each of the billing systems have their own peculiarities that cause the data content within the Verizon standard EDI 811 structure to vary. Because of the uniqueness of each billing system, Verizon identifies the originating billing system via the sender DUNS number and via a REF~06 in position 050 of the header.

This guide should be used in conjunction with the ASC X12 Version 4 Release 1 standards and the OBF/ETB EDI Guidelines - Telecommunications Billing Issue 9, Revision 4. Use both the ASC X12 and the OBF/ETB as a reference for general questions about the 811 Transaction Set. A comprehensive list of segments, data elements, and element values used by Verizon is provided in Appendix A of this guide.

NOTE: Normal and customary updates to OBF/ETB Section 10.4 Telecommunications Additional Code Lists, are done (completed) quarterly. Verizon can implement value additions or changes immediately after approval (publication or issuance). Trading Partners need to be familiar with these quarterly updates and be prepared to accept the changes.

1.3 Scope and Applicability

Verizon has produced this EDI Billing Implementation Guide for use by their EDI trading partners and is responsible for its content. This guide contains the information necessary for EDI implementation related to billing of telecommunication services with Verizon.

1.4 Document Contact Information

Comments or questions about this guide as well as technical questions about the EDI interface, EDI transmissions or Electronic Funds Transfer may be sent in an email to EDI-Implementation@verizon.com.

OBF/ETB *EDI Guidelines - Telecommunications Billing Issue 9, Revision 4* may be obtained by calling the Alliance for Telecommunications Industry Solutions (ATIS) at 202-628-6380 and are available on the Internet within the Electronic Telephone Billing home page at <http://wwwatis.org>.

ASC X12 forms and documents may be obtained from Data Interchange Standards Association, Inc. (DISA) by calling (703) 970-4480 or through the home page at <http://wwwdisa.org>.

1.5 Implementation Considerations

When a customer is ready to receive telephone billing transaction sets, Verizon will discuss a pilot program plan and develop a schedule for test transmissions. This is necessary to maintain system integrity and avoid any misunderstandings when implementing telephone billing. The pilot program will allow Verizon to test in-house system capability to meet the customer's telephone billing requirements, our EDI translation placement of the standards information and the negotiated method of transmission. Our trading partners will be able to test their method of transmission, their translation interface and their in-house system's ability to handle the telephone billing information. This guide will help clarify the data presentation by identifying where the telephone billing information will be placed in the 811 transaction set so that trading partners are able to prepare for the testing and implementation.

1.6 Modes of Operation

Verizon is prepared to begin telephone billing pilot programs with trading partners using the 811 transaction set as described in this customer guide. A pilot program sets time frames for testing in a parallel mode until our trading partners verify the EDI transmission and the ability of their systems to process the telephone bill. A parallel mode means that hard copy paper bills are sent in the normal production mode while EDI test transmissions are received. Once a consistent processing environment has been attained, Verizon will set up an implementation date for a cutover to a production mode.

1.7 Recovery Procedures

Verizon endeavors to provide an accurate and responsive EDI environment but occasionally errors may occur or data maybe lost or destroyed. Each trading partner should be prepared for and capable of reproducing any electronic transmission and/or providing backup paper documents within a reasonable time in order to fulfill business requirements.

Requests for assistance with EDI or the eFTP data communications application may also be addressed to Verizon Enterprise Center Support by calling toll free: 1-800-569-8799 or sending an email to VEC-support@verizon.com.

Your Verizon account team, Sales or Service representative, remains your resource for resolution or obtaining appropriate resources.

Verizon **requires** a 997 Functional Acknowledgment for each telephone billing transmission, as indicated in the ISA segment (ISA14) of the EDI transmission envelope. This is our standard operating procedure, which helps to track transmissions and verify receipt.

1.8 How to use the EDI Billing Implementation Guide

Verizon's EDI Billing Implementation Guide is divided into several sections.

Section 1, Introduction, gives an overview of Verizon perspective, addresses some business issues and provides a description of this guide.

Section 2, Telephone Billing Overview explains the formats and types of Verizon telephone bills and provides the structure of the 811.

Section 3, Transaction Set Conventions contains the envelope requirements and control structure, the 811 transaction set which includes the segment listings and all of the data segments and data elements used by Verizon.

Section 4, Understanding Hierarchical Levels contains the structure and outlines the dependencies of hierarchical levels of telephone billing information provided in the Detail Area of the 811 transaction set. Section 4 provides a hierarchical level chart for the nine billing levels and the information found on each level.

Section 5, Heading Section provides a table of segments depicting the structure of the heading section of the 811. After the structure table a sample mapping for the heading section is displayed with an explanation of each segment.

Section 6, Detail Section provides a sample mapping and explanation of each segment for the respective Hierarchical Levels/services. Section 6 contains three sub-sections:

6.1 High-Level (HL1 through HL4): Provides a table of segments depicting the structure of the 811 detail portion for Hierarchical Levels 1 - 4.

6.2 Detail-Level (HL5 through HL9): Provides an overview of Hierarchical Levels 5 - 7 and sample mapping and explanation for specific services depicting the use of hierarchical levels 5 - 9.

6.3 Summary/Consolidated Billing: Provides a table of segments depicting the structure of the Summary/Consolidated billing 811. After the structure table a sample mapping is displayed and is followed with an explanation of each segment.

Section 7, Summary Area provides a table of segments depicting the structure of the summary section of the 811. After the structure table a sample mapping for the summary section is displayed and is followed with an explanation of each segment.

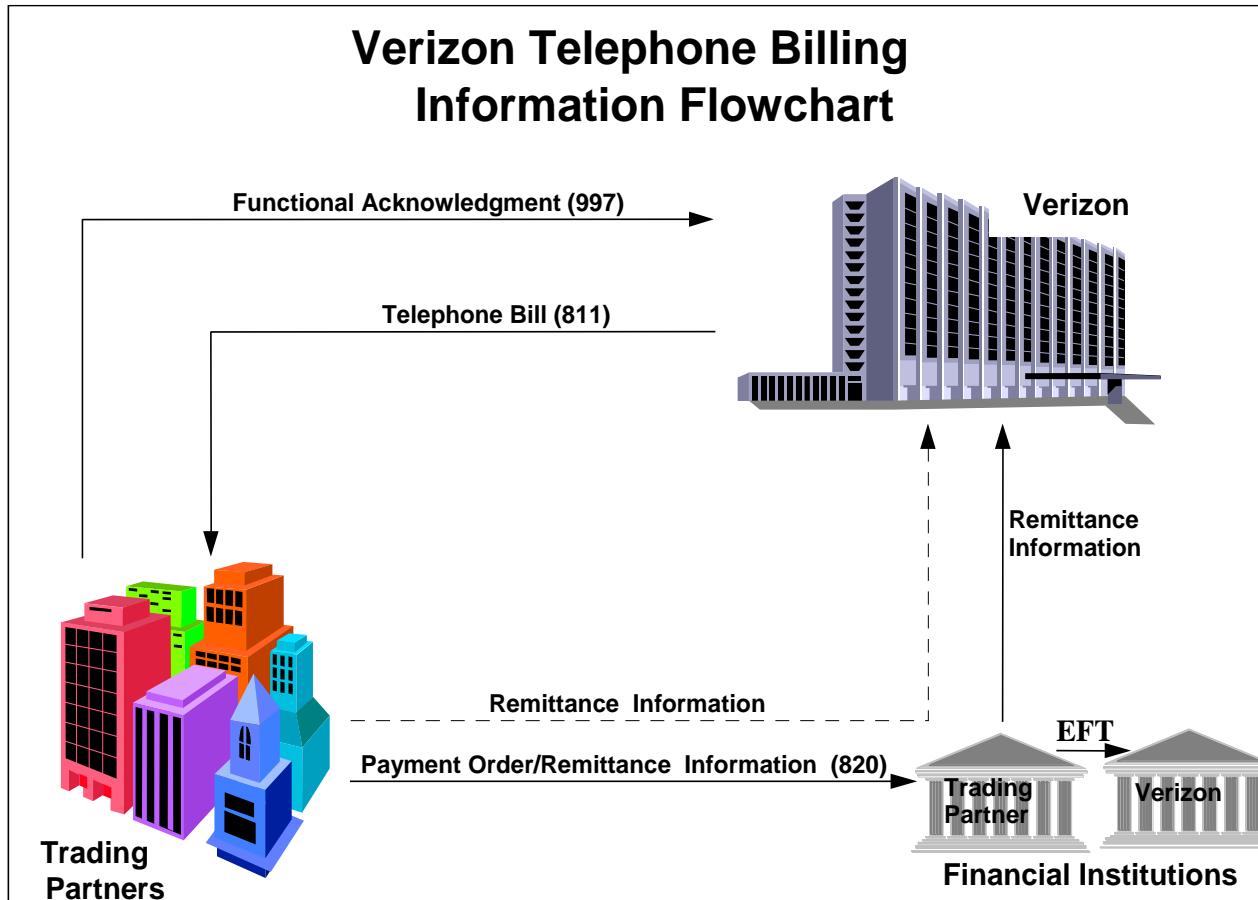

Section 8, Auditing the 811 Transaction Set explains the “summing rules” and how to balance supporting detail charges to the appropriate summary level charge.

Appendix A, Detailed Segment and Data Element provides definitions and usage rules.

2. Telecommunications Billing Overview

2.1 Verizon's Business Model

The business model diagram below shows the transaction flow between Verizon and their trading partners (TP) for telecommunications billing information.

- ◆ A telecommunications bill, 811 transaction set, is initiated by Verizon and sent to the trading partner.
- ◆ The trading partner receives the 811 transaction set, verifies the transmission's syntax and control structure information and sends a functional acknowledgment (997) to Verizon.
- ◆ Trading partner processes the 811 transaction set, verifies the information and approves for payment. A payment order/remittance advice (820) may be generated and sent to the trading partner's bank.
- ◆ The trading partner's bank renders payment to Verizon's bank by Electronic Funds Transfer (EFT) and forwards the remittance advice to Verizon.
- ◆ Alternate methods of payment include:

- Payment order may be sent to the trading partner's bank and the remittance advice may be transmitted to Verizon Accounts Receivable.
- Paper check may be sent directly to Verizon with paper remittance advice.
- Online payment through a variety of options may be managed through the Verizon Customer Center portal.

2.2 Verizon Bill Presentation

Verizon provides one implementation for the 811 transaction set across the entire national footprint. However, the data presented in the 811 transaction set can vary by the different billing systems. It is important to be aware of these various systems. For example, to identify billed products some billing systems use USOCs, others Product Elements, POEs, and others ISOCs (similar to USOCs). Verizon also uses ANSI X12 Special Charge or Alliance Codes in the EDI 811 to assist with categorization of charges. A complete list of codes is available from the X12 Standards Guide. While Verizon is in the process of collapsing the number of billing systems used, the different supported billing systems today are:

- ◆ **CABS** - Carrier Access Billing.
- ◆ **CBSS** - Local Exchange Carrier (LEC) billing for former GTE footprint (AZ, CA, FL, ID, IL, IN, KY, MI, MO, NC, NJ, NV, NY, OH, OR, PA, SC, TX, VA, VC, WA and WI).
- ◆ **CRIS** - Local Exchange Carrier (LEC) billing for Connecticut, Delaware, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island and Vermont.
- ◆ **expressTRAK** - Local Exchange Carrier (LEC) billing for District of Columbia, Maryland, Virginia and West Virginia.
- ◆ **GCS** – the GCS billing system is composed of following billing subsystems:
 - **GCS (Cycle 1 - 4)** - International Private Line, Hyperstream, Mexico GDL, GBL, IPL Internet Service, VSAT
 - **Service Type** is presented in the NM1 loop at HL3.
 - **Circuit ID** is included in the Service Type and presented in NM1 loop at HL3. There is only one circuit per location.
 - **GCS (Cycle 5)** - Managed Services
 - **Service Type** is presented in the NM1 loop at HL3.
 - **GCS F&E (Cycle 8)** - International Frame Relay
 - **Service Type** is presented in the NM1 loop at HL3.
 - **GCS GIS (Cycle 9)** - Global Inbound Service - US
 - **Calls Details are not currently available on the VB811:** IT1 SV~0500 will not contain details
 - **GIS EMEA (Cycle 10)** - Global Inbound Service - Europe
 - **Calls Details are not currently available on the VB811:** IT1 SV~0500 will not contain details
 - **GIS ASIA PAC (Cycle 11)** - Global Inbound Service - Asia
 - **Calls Details are not currently available on the VB811:** IT1 SV~0500 will not contain details
 - **ASIA PAC VOIP (Cycle 15 & 16)** - Direct Voice - Asia
 - **Calls Details are not currently available on the VB811:** IT1 SV~0500 will not contain details
 - **GCS (Cycle 30)** - International Private Line
 - **The circuit termination locations** is presented in the NM1 loop at HL3.

- **Global Voice VPN (GVV) (Cycle 32)** - International Global Voice VPN billing system. (Global Outbound Service)
- **GCS Mega (Cycle 36)** - Frame Relay
- **Global Managed Mobility (Cycle 40)** - Global Managed Mobility

- ◆ **ICI Credit Notes** - Credit notes issued against previous invoices. Certain countries require that adjustments to a previous invoice be issued as a separate document.
 - ICI Credit Notes are only issued against Prime Biller (REF*06*MU) or Prime Biller Next Gen (REF*06*PO).

- ◆ **ICI Debit Notes** - Debit notes issued against previous invoices. Certain countries require that adjustments to a previous invoice be issued as a separate document.
 - ICI Debit Notes are only issued against Prime Biller (REF*06*MU) or Prime Biller Next Gen (REF*06*PO).

- ◆ **IX Plus** - Voice and integrated Billing including local, internet dial, audio conferencing, integrated frame relay, and integrated private line, etc.

- ◆ **Mega Voice** - Conferencing (audio and net) billing.

- ◆ **Millennium** - International audio and video conferencing.

- ◆ **NBBE** - Billing for Verizon Long Distance.

- ◆ **NCBS (IBRS)** - Integrated Billing & Reporting Solution, formerly known in former MCI as Vnet®, is a strategic billing platform that bills a wide range of integrated services including long distance, toll free, local, switch digital services (domestic and international), Internet dial with voice, conferencing (audio, video, net and document) private line, data services, security services and web/collation/managed hosting, etc.

- ◆ **NCBS (Vision)** - Voice billing that includes long distance, local, switched digital services, conferencing, etc.

- ◆ **Prime Biller** – International Billing

Notes:

1. Currently, the VB811 only processes Prime Biller standalone accounts. In a future release we plan to add Prime Biller Parent / Child accounts.
 2. ICI Credit Notes & ICI Debit Notes can be issued against Prime Biller accounts. Customers that have Prime Biller accounts need to be prepared to receive VB811s for ICI Credit Notes & ICI Debit Notes. Please ensure your communications and translator is setup to for ICI Credit Notes & ICI Debit GS02s.
-
- ◆ **Prime Biller Next Gen** – US and International Billing

Notes:

1. Currently, the VB811 only processes Prime Biller standalone accounts. In a future release we plan to add Prime Biller Parent / Child accounts.
2. ICI Credit Notes & ICI Debit Notes can be issued against Prime Biller Next Gen accounts. Customers that have Prime Biller Next Gen accounts need to be prepared

to receive VB811s for ICI Credit Notes & ICI Debit Notes. Please ensure your communications and translator is setup to for ICI Credit Notes & ICI Debit GS02s.

- ◆ **Prime Biller Extended Edition (PBEE) (formerly SingleView – Network)**
- ◆ **SSB** - Customer Premise Equipment billing.
- ◆ **Vision V5** - Billing for Verizon Online, FiOS TV and FiOS Digital Voice
- ◆ **WIN** – Wholesale Invoicing Network billing system.

Types of Bills Provided: Billing accounts are provided in one of two arrangements (this is controlled by the billing system).

- ◆ **Stand-Alone Account Billing** - This billing arrangement produces one bill per account number.
- ◆ **Consolidated Billing Account** - This billing arrangement consolidates several single accounts under one CBA (master) account number and produces one Summary Master bill and supporting component bills. The CBA is the bill invoice and each single account is presented as a memo invoice. Examples are shown in the section “Consolidated 811”. Bill invoice versus memo invoice is further explained in Appendix A of this document under BIG07.

2.3 Formats of Bills Provided

Billing accounts are provided in one of four (4) formats:

2.3.1 Summary-Level Format

Includes the EDI 811 Heading Section, Summary Section, and Detail Section HL 1 (Service Provider) through HL 4 (Group). These levels provide the information needed to pay the bill. For each service provider, total charge amount and a summary of charges by service type are presented. Supporting details for Levels 5 - 9 are not furnished with Summary Format. For summary billing arrangement, this format includes only the master-account and does NOT include the sub-accounts. This option is not available for IX Plus Summary Billing Accounts.

2.3.2 High-Level Format

Includes the EDI 811 Heading Section, Summary Section, and Detail Section HL 1 (Service Provider) through HL 4 (Group). These levels provide the information needed to pay the bill. For each service provider, total charge amount and a summary of charges by service type are presented. Supporting details for Levels 5 - 9 are not furnished with Summary Format. For summary billing arrangement, this format includes the master-account and sub-accounts.

2.3.3 Summarized Detail-Level Format

Includes the EDI 811 Heading Section, Summary Section, and Detail Section HL 1 (Service Provider) through HL 8 (Charge Detail). A summarization of charges is provided when details are not available. For summary billing arrangement, this format includes the master-account and sub-accounts.

2.3.3.1 Summarized Detail-Level Format – Call Details

For call details, we create the HL8-level VB811 by sorting and summarizing the TCDs into SLNs at HL8. To do this we use the following SI pairs from the TCDs (and then show these same SI pairs on the SLN we create):

SI Pair used in Detail-Level Format	
BA	Band
CE	Cellular Air Time Package Code
CT	Common Segment Hops
CZ	Cellular Usage Indicator
DS	Discount Planned Code
MC	Message or Rate Class
MT	Message Type
P0	Pricing Plan Type Indicator
R2	Call Routing Termination Code
RJ	Rate Zone for Taxing (Switch / Taxing Geo code)
RP	Rate Period Code
RS	Rate Schedule
RY	Local / Toll Indicator
SD	Settlement Code
SF	Service Feature -- Advanced Card Feature Codes:
SS	Service Sub-category Code
TE	Transmission Speed
TT	Transmission Type
ZC	Service Method Entry Code
ZD	Call Termination
ZE	Access Code for Conferencing.
ZF	Operator Assisted Code

If the call originates or terminates outside the US, we include the origination country in a SI Pair OL in the SLN loop and the termination country in the SI Pair TL in the SLN loop. The origination and/or termination country is used in the sorting and summarizing of the calls at HL8-level.

2.3.3.1 Summarized Detail-Level Format – Conference Call

For conferencing, we create the HL8-level VB811 by sorting and summarizing the conference caller charges by conference call. Note: we only summarize the SV*0500 usage.

2.3.4 Full Detail-Level Format

Includes the EDI 811 Heading Section, Summary Section, and Detail Section HL 1 (Service Provider) through HL 8 (Charge Detail) and/or HL 9 (Line Detail). A summarization of charges is provided when details are not available. For summary billing arrangement, this format includes the master-account and sub-accounts.

2.4 Structure of the 811

The 811 transaction set is divided into three tables that are the basic structure of most EDI transaction set standards. The three tables are:

Table 1, Heading Section provides information about the billing provider and the customer billed, the account billed, the nature and type of bill rendered. The Heading Section also contains billing terms and

conditions and tax information applicable to the entire bill. There are no billing amounts in the Heading Section.

Table 2, Detail Section provides details of charges that appear on the current month's bill. These charges may include; monthly services, additions and changes (OC&C), optional calling plans, volume discount plans, long distance, other usage, taxes, surcharges and special allowances. The detail section is divided into 9 hierarchical levels.

Level 1 - Service Provider level, contains information about the actual company rendering the services. Since Verizon provides billing services for other carriers, it is common for one bill and/or account to have multiple service providers.

Level 2 - Billing Arrangement level, references information on the individual component bills (sub-accounts) to the Master.

Level 3 - Sub-billing Arrangement level, is used to provide the location/account (Node ID) information.

Level 4 - Group level, contains summary charges for services billed.

Level 5 - Category level, is used to group details together by circuit number, Switch Board number and/or Centrex number.

Level 6 - Sub-category level, is used to group details together by circuit component number, Customer Reference Number, Vendor Order Number, Service Number and/or BAC.

Level 7 - Type level, is used to group details together by WTN, earning number, billing number, call card, conference or other sort breaks.

Level 8 - Charge Detail level, contains supporting details for charges at the Group level.

Level 9 - Line Detail level, contains supporting usage and charge detail for charges at either Level 4 or Level 8.

NOTE: Verizon' use of the hierarchical levels is explained in the Detail Section, Section 7 of this document.

Table 3, Summary Section, summarizes the amount billed. The summary section contains total current charges, payments, adjustments, previous billed amount and net amount due after payments and adjustments. There are key amounts contained in the summary section that can be used for validation. Section 8 of this document provides the 'summing rules'.

2.5 Use of the 820

The 820 transaction set, Payment Order/Remittance Advice, is used to provide authorization for payment and detailed information about the payment. As previously mentioned, there are several methods of handling the payment process. Verizon encourages the use of the 820 transaction set and provides complete remittance information in REF02 where REF01 is 'AP'. As explained previously in the Business Model section, Verizon does not receive 820s directly. Verizon uses the Financial EDI model where the 820 goes to the Verizon customer's bank.

2.6 Information to Have When Contacting Verizon

Traditionally when a customer has questions about their bill, they contact a Verizon representative for assistance. The representative needs the billing date, billing account number, and the nature of the question in order to be of assistance. The required information is provided in the 811 Transaction Set. The following data elements are required for billing inquiry:

Bill Date	BIG Segment – BIG01
Invoice Number	BIG Segment – BIG02
Billing Account Number	REF Segment – REF02 when REF01 = '11' REF Segment – REF02 when REF01 = '12' REF Segment – REF02 when REF01 = '14' REF Segment – REF02 when REF01 = '06' REF Segment – REF02 when REF01 = 'U1'
Billing System	
Corp ID	

2.7 Data Element Separator, Segment Terminator and Component Element Separator

When displaying mapping examples in this guide, the tilde (~) is used as the data element separator, the vertical line (|) is used as the segment terminator and the low line (—) is used as the component element separator. Verizon 811 transaction set production files may use different data element separator and segment terminator values. These values can be negotiated with each trading partner. The “at” symbol (@) cannot be used as an EDI separator because Verizon uses the character in email address fields.

2.8 ASC x12 Extended Character Set

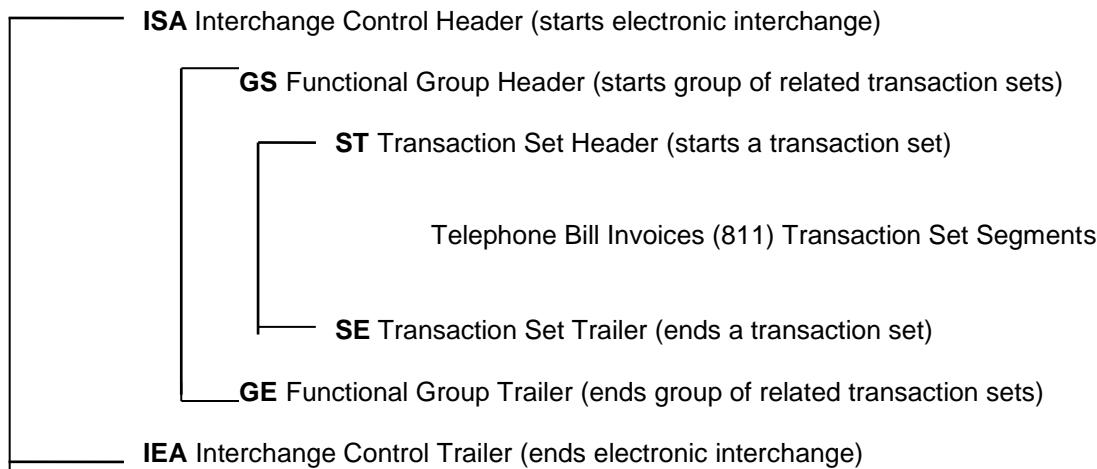

The VB811 uses the ASC x12 Extended Character Set. The ASC x12 standard supports the following Special characters under the Extended Character Set:

ISO Document 8859-1 (Latin-1 Alphabet):

À, Á, Â, Ã, à, á, â, ã
È, É, Ê, Ë, è, é, ê, ë
Ì, Í, Î, Ï, í, î, ï

3. Envelope Control Structure

Each EDI interchange must occur in a predefined sequence in order to ensure the information can be read and understood. The envelope control structure used to transmit a group of EDI transaction sets is comprised of the Interchange Control Header (ISA), Interchange Control Trailer (IEA), Functional Group Header (GS), and Functional Group Trailer (GE) as follows:

3.1 Interchange Envelope

The Interchange Envelope identifies the start and the end of an EDI transmission. It also identifies the sender and receiver of the interchange and provides control information. The Interchange Envelope consists of an Interchange Control Header (ISA) and an Interchange Control Trailer (IEA).

Segment ID	Segment Description
ISA	Interchange Control Header
IEA	Interchange Control Trailer

Interchange Control Header

The ISA Interchange Control Header is the first segment of an EDI transmission. It is used to start and identify an interchange of one or more functional groups and interchange-related control segments. The information provided by Verizon in the **ISA segment** follows.

ISA Example:

ISA~00~~00~~01~107212169ESG~01~1234567890123~990401~2331~U~00401~000000018~0~P~_||

Element ID	Data Element	Element Name / Actual Value(s)
ISA01	I01	Authorization Info Qualifier 00 (No authorization info present)
ISA02	I02	Authorization Info 10 spaces

ISA03	I03	Security Info Qualifier 00 (No security info present)
ISA04	I04	Security Information 10 spaces
ISA05	I05	Interchange ID Qualifier 01 (DUNS)
ISA06	I06	Interchange Sender ID 107212169ESG (Verizon expressTRAK or NBBE)
ISA07	I05	Interchange ID Qualifier 01 (DUNS)
ISA08	I07	Interchange Receiver ID
ISA09	I08	Interchange Submit Date (YYMMDD)
ISA10	I09	Interchange Submit Time (HHMM)
ISA11	I10	Interchange Control Stds ID U (U.S. EDI Community of X12)
ISA12	I11	Interchange Ctrl Version No 00401 (ANSI Version 4, Release 1)
ISA13	I12	Interchange Control Number
ISA14	I13	Acknowledgment Requested 0 (No Acknowledgment Requested)
ISA15	I14	Test/Production Indicator T (Test Data) or P (Production Data)
ISA16	I15	Sub Element Separator —

Interchange Control Trailer:

The IEA Interchange Control Trailer is the last segment of an EDI transmission. It is used to end and identify an interchange of one or more functional groups and interchange-related control segments. The information provided by Verizon in the **IEA segment** follows.

IEA Example: IEA~1~000000018|

Element ID	Data Element	Element Name
IEA01	I16	Number of Included Functional Groups
IEA02	I12	Interchange Control Number (as in ISA13)

3.2 Functional Group Envelope

All 811 transaction sets provided will be enveloped within a functional group. The purpose of the functional group is to indicate the beginning of a functional group and to provide control information. The functional group consists of a Functional Group Header (GS Segment) and a Functional Group Trailer (GE Segment).

Segment ID	Segment Description
GS	Functional Group Header
GE	Functional Group Trailer

Functional Group Header:

The Functional Group Header is the first segment of an 811 transaction set. It is used to indicate the start and identification of one or more 811 transaction sets. The information provided by Verizon in the **GS segment** follows.

GS Example: GS~CI~ETRAK-V1~123456789012~19990401~2331~152~X~004010|

Element ID	Data Element	Element Name / Actual Value(s)
GS01	479	Functional Identifier Code CI (Consolidated Invoice)
GS02	I42	Application Sender's Code ETRAK-V1 (Verizon expressTRAK or NBBE)
GS03	I24	Application Receiver's Code (same as in ISA08)
GS04	029	Functional Group Date (CCYYMMDD)
GS05	030	Functional Group Time (HHMM)
GS06	028	Functional Group Control Number
GS07	455	Responsible Agency Code X = Accredited Standards Committee X12
GS08	480	Version/Release = 004010

Functional Group Trailer:

The Functional Group Header is the last segment of an 811 transaction set. It is used to indicate the end and identification of one or more 811 transaction sets. The information provided by Verizon in the **GE segment** follows.

GE Example: GS~2~152|

Element ID	Data Element	Element Name / Actual Value(s)
GE01	097	Total Number of Transaction Sets
GE02	028	Functional Group Control Number (as in GS06)

3.3 Transaction Set Envelope

Transaction Set Header:

The Transaction Set Header is used to indicate the start of and identify a transaction set and assigns a control number. The information provided in the **ST segment** follows.

ST Example: ST~811~0204|

<i>Element ID</i>	<i>Data Element</i>	<i>Element Name / Actual Value(s)</i>
ST01	143	Transaction Set ID Code 811 = Consolidated Service Invoice/Statement
ST02	329	Transaction Set Control Number (The value in ST02 must match the value in SE02 of the transaction set trailer.)

Transaction Set Trailer:

The Transaction Set Trailer is used to indicate the end of a transaction set, to provide the count of the transmitted segments which include the beginning (ST) and ending (SE) segments and to provide the Assigned control number. The information provided in the **SE segment** follows.

SE Example: SE~45~0204|

<i>Element ID</i>	<i>Data Element</i>	<i>Element Name / Actual Value(s)</i>
SE01	096	Number of included segments
SE02	329	Transaction Set Control Number (The value in SE02 must match the value in ST02 of the transaction set header.)

4. Understanding Hierarchical Levels (HL)

The hierarchical levels used by Verizon and other members of the telecommunications industry reflect the needs of the service providers in responding to the billing requests of their trading partners.

The hierarchical levels are dependent on billing data. For further information reference Ordering and Billing Forum (OBF) EDI Telecommunications Billing (ETB) (formerly TCIF) EDI Guidelines - Telecommunications Billing Issue 9, Revision 4.

The hierarchical structure contains a parent/child relationship, which establishes the levels of billing data. For example, the bill data is organized by Service/Billing Provider (HL 1), within service provider by Group charge (HL 4) and within each Group by Charge Detail (HL 8). In this example, the Service/Billing Provider is the parent to each Group and each Group is a parent to each of its Charge Detail items. Information provided at a parent level applies to all children associated with that parent.

The following provides a description of the nine hierarchical levels used in the 811 transaction set. In the following descriptions the HL numeric value represents the Hierarchical Level Code (HL03) of the HL segment.

Hierarchical Level 1 (HL 1) - Service/Billing Provider

At least one occurrence of HL 1 is required for each 811. Within the HL 1 one occurrence of the NM1 loop is required. The NM1 is used to designate the company providing the billing and/or services. The ITA loop, when used at this level, depicts special charges, surcharges, credits and allowances that apply to this Service/Billing provider.

Hierarchical Level 2 (HL 2) - Billing Arrangement (used by Summary Master-Accounts)

Hierarchical Level 3 (HL 3) - Sub-Billing Arrangement (used for Location Account (NODE ID))

HL 2 and HL 3 are optional and allow for the flexible segregation of charges under billing arrangements. This segregation is achieved through the use of the LX loop by using LX/SI segments. If needed the QTY/SI segments may also be used. The ITA loop, when used at this level, depicts special charges, surcharges, allowances and credits which apply to this Billing Arrangement/Sub-Billing Arrangement Level.

Hierarchical Level 4 (HL 4) - Group

At least one occurrence of HL 4 is required for each Service/Billing Provider (HL 1). At HL 4 only the IT1 loop is valid. It is used to display the Group charges for the services billed. When this hierarchical level has no children (HL04 value of '0') multiple IT1 loops may appear within the HL 4 structure. When there are children (HL04 value of '1') only one IT1 loop can be presented within the hierarchical level.

Hierarchical Level 5 (HL 5) - Category (Circuit, Switchboard and/or CENTREX)

Hierarchical Level 6 (HL 6) - Sub-Category (circuit component number, Customer Reference Number, Vendor Order Number, Service Number and/or BAC.)

Hierarchical Level 7 (HL 7) – Type (Earning Number, WTN, Conference ID, BTN, call card, conference or other sort breaks)

HL 5, 6, and 7 are optional. They are similar to HL 2 and HL 3 in that they provide further flexibility in segregating charges. If HL 6 and/or HL 7 are present, there may or may not be an associated HL 5 or HL 6. The LX, NM1 and ITA loops can be used to provide a breakdown of charges displayed at HL 4.

Hierarchical Level 8 (HL 8) - Charge Detail

HL 8 is optional. When used, it will provide a breakdown of HL 4 charges. The SLN loop, which can be used only at HL 8, provides the sub line item detail. When HL 8 has no children (HL04 value of '0') multiple SLN loops may appear within this hierarchical level. When there are children (HL04 value of '1') only one SLN loop can be presented within the hierarchical level.

Hierarchical Level 9 (HL 9) - Line Detail

HL 9 is optional. The TCD and USD loops, which can be used only at HL 9, will provide usage details associated with toll calls, optional call plans, etc.

Section 7.2.5 of the OBF/ETB /EDI Guideline for the 811 has a diagram of the possible relationships of the Hierarchical levels within the 811 Transaction Set. Each of the services describe later in this documentation illustrates the structure and dependencies of the hierarchical levels of the telephone billing information provided in the Detail Section of the 811 transaction set.

In order to understand the 811 transaction set, it is necessary to understand the use of the hierarchical level segments as they reflect the 811 structure. The hierarchical levels provide a parent/child relationship that organizes the invoice into billing levels (parent) that have sub-levels (child) providing detailed information about the billing level.

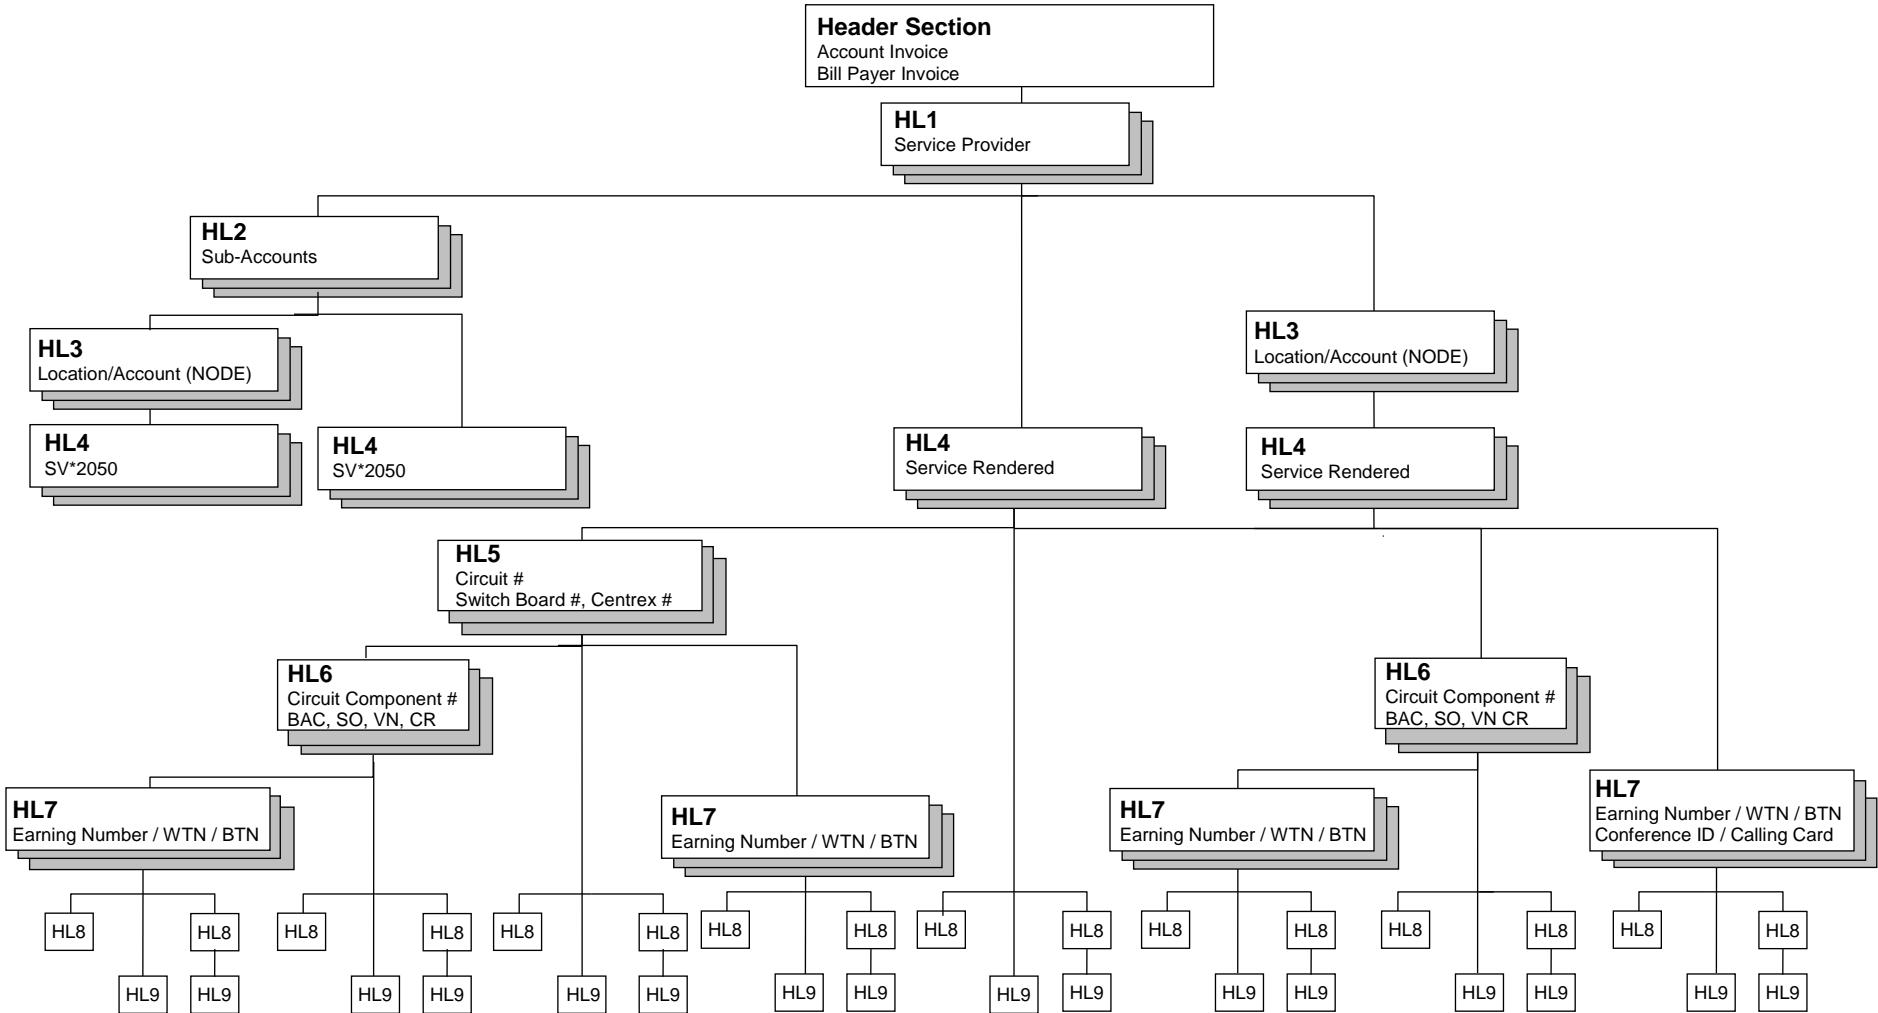

The parent/child relationship is established between levels of billing data using data elements in the HL segment and are represented as:

HL~ ID Number~ Parent ID Number~ Level Code~ Child Code|

- ◆ **HL01** (ID Number) is a unique number assigned by the provider to identify a particular data segment within the hierarchical structure.
- ◆ **HL02** (Parent ID Number) is the HL01 value of the parent HL loop.
- ◆ **HL03** (Level Code) identifies the hierarchical level of 1 - 9.
- ◆ **HL04** (Child Code) indicates if there are additional child (supporting detail) HL segments associated with the hierarchical level. HL04 is a requirement. The value of '1' indicates that the hierarchical level has children/supporting detail. The value of '0' indicates that the hierarchical level has no children/supporting detail.
 - For example, if billing is organized by service provider and the service provider detail is organized by charge type at the group level, the service provider is the Parent HL. The charge type at the group level becomes the Child HL to the service provider level Parent HL.
- ◆ Examples illustrating use of the HL segment in the 811:
 - **HL~1~0~1~1|** This is the initial HL segment. HL02 is not provided at this level because the information does not have a parent HL loop. HL03 signifies HL 1, Service Provider level. HL04 value of '1' indicates that there is supporting detail.
 - **HL~2~1~4~0|** HL02 indicates that this information supports and is related to HL number 1. HL03 signifies HL 4, Group Level. HL04 value of '0' indicates that there is no supporting detail.

Additional examples and further information regarding the use of the HL segment in the 811 can be found in the ASC X12 Version 4 Release 1 standards and the (OBF/ETB) (formerly TCIF) EDI Guidelines - Telecommunications Billing Issue 9, Revision 4. Use both the ASC X12 and the OBF/ETB as a reference for general questions about the 811 Transaction Set.

5. Verizon's Use of the EDI 811 Hierarchical Levels (HL)

6. Heading Section of the EDI 811

The purpose of the Heading Section of the 811 is to provide information about the bill rendered, the recipient of the bill (Verizon trading partner) and the provider of the bill (Verizon).

The format for this section provides a table of segments depicting the structure of the portion of the 811 being explained. After the structure table, a sample mapping for the respective area of the 811 is displayed. The example does not include all the Segments and Codes that could be used in any 811 Transaction Set. Please refer to Appendix A for a full list of Segments and Codes that can be used. The sample mapping reflects telephone billing data for a single expressTRAK account.

A comprehensive list of segments, data elements, and element values used by Verizon is provided in Appendix A of this guide.

Structure of the Heading Section:

Segment ID	Position	Segment Description	Loop	Max Use	O/M
ST	010	Transaction Set Header	N/A	1	M
BIG	020	Beginning Segment for Invoice	N/A	1	M
NTE	030	Note	N/A	100	O
CUR	040	Currency	N/A	1	O
REF	050	Reference Numbers	N/A	>1	M

N101	098	Entity Identifier Code = PE = Payee
N102	093	Name
N301	166	Address Information
N401	019	City Name
N402	156	State
N403	116	Postal Code = Zip + 4

REF (Reference Numbers) Sample: REF~IS~025|

Element ID	Data Element	Element Names / Values
REF01	128	Reference Number Qualifier IS = Invoice Number Suffix
REF02	127	Reference Number 025 = Revenue Accounting Office (RAO)

7. Detail Section of the EDI 811

The purpose of the Detail Section of the 811 is to provide information about services and charges that are being billed. The activity included in the 811 is generally dated from the previous invoice period, as specified in the DTM segments of the heading. Examples of activity that may be included in the detail section are Monthly Service, Additions and Changes (OC&C), Optional Calling Plans, Discount Plans, Itemized Calls, Taxes, Surcharges, and Late Payment Charges.

At least one Service Provider Level (HL1) is required for each 811 and at least one Group Level (HL4) for each HL1. The Service Provider Level (HL1) groups the billing information by service provider and by the associated charges, which are presented by type of charge in HL4. Consolidated accounts have a Billing Arrangement Level (HL2) and a Group Level (HL4) to present charges by component account.

The format for this section provides a table of segments depicting the structure of the portion of the 811 being explained. After the structure table a sample mapping for the respective area of the 811 is displayed.

A comprehensive list of segments, data elements, and element values used by Verizon is provided in Appendix A of this guide.

7.1 High-Level (HL1 through HL4) Examples:

Hierarchical Levels 1 through 4 are only included in the “Summary-Level format”, “High-Level Format” and “Detail-Level format”. The high levels contain information up to summarized service type charges (HL4).

7.1.1 HL1 – Service Provider

The Service Provider Level (HL1) gives information about the company rendering billing and/or services. There may be several Service Providers in one bill since Verizon provides billing services for multiple carriers.

Segment ID	Position	Segment Description	Loop	Max Use	O/M
HL	010	Hierarchical Level	HL1	1	M
LX	020	Sequentially Assigned Number	LX	1	O
PID	040	Product/Item Description	LX	30	O

7.1.2 HL2 – Sub-Account Charges on the Master Account’s Bill

The Billing Arrangement level is used with Consolidated Billing also referred to as Summary Billing in Verizon. Consolidated Billing/Summary Billing is an arrangement where multiple single bills or components, referred to as sub-accounts or Invoice Points, are combined into one master bill. Billing Arrangement provides a list of component accounts (sub-accounts or Invoice Points) and their associated total amount billed. Each component bill has a billing account number where charges are accumulated. The component current amount due is shown in the summary section of the component and is included in the consolidated bill total. The components are separate ‘memo’ 811 transaction sets and the term ‘memo’ indicates that the purpose of the transaction set is to provide additional detail for an invoice as opposed to an actual invoice.

On a consolidated bill, each component is represented by Billing Arrangement Level segment for the account number and Group Level segment for the amount due. These segments are subordinate to the Verizon Service Provider Level.

Segment ID	Position	Segment Description	Loop	Max Use	O/M

DTM06	1251	Date Time Period format = CCYYMMDD-CCYYMMDD format

7.1.4 HL4 – Type of Charge – IT1

A Group Level (HL4) indicates each type of charge and contains information that identifies the content of the detail that follows. When detail is provided by the billing system the information is available in EDI. When “Summary-Level format” or “High-Level format” is chosen details are excluded and charges appear at the Group Level with the Hierarchical Child Code set to zero ('0') to indicate no supporting detail.

The IT104 element contains the total charge amount for the charge type. When details (HL 5 – 9) are present, the sum of each applicable detail amount equals the IT104 amount (see Summing Rules, Section 8.2). This allows the user to balance the detail amounts to the total charge amount. The sum of all IT104 charge amounts, plus certain taxes and surcharges, equals The Total Current Charges (TDS01). See Summary Section, Section 7, for specific details.

Segment ID	Position	Segment Description	Loop	Max Use	O/M

ITA16	662	Relationship Code I = Included (for summing and auditing)

\$ Refer to Additional Code Lists Used by OBF/ETB (Section 10.4) for values.

7.2 Detail-Level (HL5 through HL9) Examples:

Hierarchical Levels 5 - 9 are only included in the “Detail-Level format”. The detail levels contain supporting information for each service type and are not included if “Summary-Level format” or “High Level format” are chosen. Because of the diversity in supporting details associated with services billed by Verizon, this portion of the Detail Section presents only an overview of the detail levels, HL 5 - 9.

The remaining portions of this section provide examples of the use and structure of HL 5 – 9 with information and presentation of specific service types.

Hierarchical Level 5 Category, Level 6 Sub-category and Level 7 Type are used to group related details together. For example, Itemized Calls are grouped by telephone line number presented once by a Level 7 Type that applies to all subordinate Level 9 line details. When the telephone line number changes, a new Level 7 is created along with the Level 9 line details. This process is repeated for all itemized calls. Levels 5 - 7 are used under different conditions for the various service types and their uses are explained in the following sections addressing service types.

Hierarchical Level 8 Charge Detail and Level 9 Line Detail are used to present detail items and supporting usage detail for the various service types. Level 8 provides a breakdown of group level charges for product codes (USOC, ISOC or POE) and Level 9 provides supporting usage details for group and charge level information (itemized calls and local calls). The uses for Levels 8 and 9 are explained in the following sections addressing service types.

7.2.1 HL5 – Circuit, Switch Board and/or Centrex

HL5, category level, is used to group details together by circuit number, Switch Board number and/or Centrex number.

Structure of HL5 Circuit, Switch Board and/or Centrex:

7.2.3 HL7 – Earning Number, WTN, Billing Number, Calling Card, Conference and/or other Billing Information.

HL7, type level, is used to group details together by earning number, WTN, billing number, Calling Card, Conference and/or other Billing Information.

Note on Circuit Number: We are currently presenting the Circuit number at HL5 & HL7. Please create your data maps to use HL5 only for the Circuit numbers. In the future we plan to remove the Circuit Number from HL7 and only provide in HL5.

7.2.4 SV~0110: Recurring

Recurring Details (SV~0110) is used to provide the monthly charges on the ARBOR, IBRS, IX Plus and Vision bills. Recurring Details are essentially the same as the Monthly Service Charge details, except the IT1 at HL4 contains 0110. See paragraph 7.2.5 for specific details of segments used and samples.

7.2.5 SV~0200: Monthly Service Charge

Monthly Service Charge details represents the recurring service and product charges (USOC, ISOC or POE). This information is presented using HL 5, 6 and 7 for grouping related detail items and HL 8 for each individual detail item. HL 5, Category, is used to group charges by Switchboard/PBX/SYS Account Code(s) and Centrex Location or Location Group as applicable. HL 6, Sub-category, is used to group data by Billing Agency Code (department number). HL 7, Type, is used to group data by Telephone/Circuit Number.

The SLN06 element contains the cost of the detail item. The sum of all SLN06 amounts equals the IT104 amount for Monthly Service (IT107 = 0200). This permits the user to verify the IT104 amount for Monthly Services.

Structure of Monthly Service Charge Details:

7.2.5.1 Centrex Addendum to SV~0200 (IT107 = 0200 and (SLN10 = 220 or 225))

Centrex Summary Charges are only provided to Verizon South Legacy system Centrex customers in Pennsylvania and Delaware.

Centrex Summary information is provided by Account and Location using HL 8, Charge Detail, for each individual detail item. The Account summary contains the number of centrex lines and total amount for those lines. The Location summary contains the number of centrex lines assessed a mileage charge and the total amount for those lines.

The SLN06 element contains the cost of the detail item. The sum of all SLN06 amounts equals the IT104 amount for Monthly Service (IT107 = 0200). This permits the user to verify the IT104 amount for Monthly Services.

Structure of Centrex Summary:

Segment ID	Segment Position	Segment Description	Loop	Max Use	O/M

7.2.6 SV~0305: Service and Equipment Information

Service and Equipment Information Details (SV~0305) is used to provide the monthly charges on CABS bills. Service and Equipment Information Details are essentially the same as the Monthly Service Charge details, except the IT1 at HL4 contains 0305. See paragraph 7.2.5 for specific details of segments used and samples.

7.2.7 SV~0400: Other Charges & Credits /Additions & Changes

Additions & Changes (OC&C) represent one-time charges and credits in addition to fractional charges and credits. Additions & Changes Detail is the term used with Verizon expressTRAK while the Verizon Legacy systems still use the term Other Charges & Credits (OC&C).

The information is presented using HL 5, 6, and 7 for grouping related detail items and HL 8 for each individual detail item. HL 5, Category, is used to group charges by Switchboard Code (PBX Code, SYS Account Code) and Centrex Location/Location Group where applicable. HL 6, Sub-category, is used to group data by Billing Agency Code (department number) and Service Order Number. HL 7 is used to group data by Telephone/Circuit Number.

The SLN06 element contains the cost of the detail item. The sum of all SLN06 amounts, plus all ITA 07 amounts (see **NOTE** below), equal the IT104 amount for Additions and Changes Detail IT107 = 0400. This allows the user to verify the IT104 amount for Additions and Changes.

NOTE: Due to Legacy Verizon South system constraints, Late Payment Charges may continue to appear in Additions & Changes (OC&C) until conversion to expressTRAK and the ITA07 would contain the Late Payment Charge amount.

Structure of Additions & Changes Detail:

7.2.8 SV~0500: Itemized Call

Itemized Calls, local and long distance, information is presented using HL 6 and 7 for grouping related detail items and HL 9 for each individual detail item. HL 6, Sub-Category, is used to group charges by Billing Agency Code (department number). HL 7, Type, is used to group data by telephone line number.

Itemized calls associated with Interexchange Carrier Billing, Optional Calling Plans and Local Usage are informational which is reflected by a value of "O" in element TCD16. See specific section(s) for more information.

Note: For SingleView, the Line/Circuit Service Attributes can be found with the Monthly Recurring Charges

7.2.8.1 WATS Addendum to SV~0500 (IT107 = 0500, SLN10 = 1000)

The WATS Summary is broken down into two components; Charge Detail and Line Detail. The WATS Charge detail contains rates, usage and charges. The WATS Line Detail contains tapers for hourly rates and time ranges; time and messages used and number of inward calls to 800 Service that could not complete due to a busy condition. Each WATS Service is summarized by service group and is presented using a HL 8, Charge Detail and a HL 9, Line Detail.

The SLN06 element contains the billed amount for WATS Services. The amount is included in the IT104 for Itemized Calls (IT107 = 0500).

Structure of WATS:

7.2.8.2 ISDN Addendum to SV~0500 (IT107 = 0500, SLN10 = 1420)

ISDN account level charges are presented at HL8.

ISDN Itemized Calls, local and long distance, information is presented using HL 7 for grouping related detail items and HL 9 for each individual detail item. HL 7, Type, is used to group data by telephone line number.

Structure of ISDN:

Segment ID	Position	Segment Description	Loop	Max Use	O/M
HL	010	Hierarchical Level	HL8	1	M
SLN	390	Subline Item Detail	SLN	>1	M
SI	400	Service Characteristic	SLN	>1	M

7.2.8.3 CLASS Addendum to SV~0500 (IT107 = 0500, SLN10 = 1615)

Custom Local Access Switch Service (CLASS) account level charges are presented at HL8. The SLN06 element contains the rate; SLN04 element contains the quantity. Since the SLN05 value is not "M4", the SLN06 value must be multiplied by the SLN04 value to determine the billed amount. The sum of all billed amounts (SLN06 times SLN04) is included in the IT104 amount.

Structure of Custom Local Access Switch Services (CLASS):

Segment ID	Position	Segment Description	Loop	Max Use	O/M
HL	010	Hierarchical Level	HL8	1	M
SLN	390	Subline Item Detail	SLN	>1	M
SI	400	Service Characteristic	SLN	>1	M

7.2.8.5 Conferencing Charges under SV~0500

Conferencing charges are presented at HL8.

HL7 contains the conference identification information

Structure of Conferencing Charge Details:

Segment ID	Segment Position	Segment Description	Loop	Max Use	O/M
HL	010	Hierarchical Level	HL7	1	M
LX	020	Sequentially Assigned Number	LX	1	M
SI	030	Service Characteristic	LX	1	M
PID	040	Product/Item Description	LX	200	O
REF	050	Reference Identification	LX	>1	O

DTM	070	Date/Time Reference	LX	8	O
NM1	110	Individual or Organization Name	NM1	1	O
PER	160	Administrative Communications Contact	NM1	>1	O
HL	010	Hierarchical Level	HL8	1	M
SLN	390	Subline Item Detail	SLN	>1	M
SI	400	Service Characteristic	SLN	>1	M
PID	410	Product/Item Description	SLN	200	O
CUR	420	Currency	SLN	1	O
INC	430	Installment Information	SLN	>1	O
ITA	440	Allowance, Charge or Service	SLN	10	O
TXI	450	Tax Information	SLN	>1	O
REF	460	Reference Numbers	SLN	1	O
DTM	480	Date / Time Reference	SLN	>1	O
QTY	510	Quantity	SLN/QTY	1	O
NM1	530	Participant Name	SLN/NM1	1	O

7.2.9 **SV~0510: Interexchange Carrier Invoice Billing** (also called Invoice Ready Billing, IRB)

This sample mapping contains Interexchange Carrier Invoice Billing summary data with the associated Itemized Calls appearing with Itemized Calls.

Exceptions may occur when it is required to include information from carrier invoice records, such as proving the detail level(s) to the proper summary level(s) may not balance. In this case, the 'foreign' information will be inserted 'as received' from the outside source. Descriptions, content, initialization, etc. of the inserted information is governed by the information/service provider.

The IT104 element contains the amount due for the invoice. The SLN06, ITA07 and TXI02 elements provide a breakdown of the invoice charges not including Itemized Call charges and are informational only.

Structure of Interexchange Carrier Invoice Billing

Segment ID	Position	Segment Description	Loop	Max Use	O/M

7.2.10 SV~0600: Directory Advertising

The information is presented using HL 8 for each individual detail item.

The SLN06 element contains the cost of the detail item. The sum of all SLN06 amounts equal the IT104 amount for Directory Advertising IT107 = 0600.

Structure of Additions & Changes Detail:

7.2.11 SV~0700: Usage

Charges associated with Usage have two (2) components that are Account-Level Summary and Line-Level Summary.

The amount billed is contained in the Account-Level Summary and can be identified by a value of "I" in SLN08 element. Usage information at the Account-Level is presented using HL 8, Charge Detail, and HL 9, Line Detail.

The SLN06 element contains the total usage charge by type of service. This amount is included in the IT104 amount for the appropriate Product/Service ID (IT107 = 0700) and allows the user to verify the IT104 amount for Usage.

The Usage Line-Level Summaries provide a breakdown of the usage by individual telephone number and are informational in nature. Usage information at the Line-Level is presented using HL 7, Type, and HL 9, Line Detail.

Structure of Usage (SV~0700):

Segment ID	Position	Segment Description	Loop	Max Use	O/M

7.2.12 SV~0705: Measured Service

Charges associated with Measured Service have two (2) components, Account-Level Summary and associated subordinate Line-Level Summaries. The total number of billable message units and the billable amount is contained in the Account Level Summary. The Line level Summaries provide a breakdown of the message units used per line and are informational in nature. Message Unit information at the Account-Level is presented using HL 8, Charge Detail. Line-Level is presented using HL 7, Type, and HL 9, Line Detail.

The SLN06 element contains the cost of Message Units. The sum of all SLN06 amounts is included in the IT104 amount for Message Units (IT107 = 0710). This allows the user to verify the IT104 amount for Message Units.

Structure of Measured Service Summary:

Segment ID	Position	Segment Description	Loop	Max Use	O/M

7.2.14 SV:0715: CABS Usage

CABS Usage charges are presented in HL 8, Charge Detail, using SLN loops. The included sub-total charges, identified by an SLN08 value of "I", can be presented by monetary amount (SLN05 = M4) or by rate and usage quantity (SLN05 not equal M4).

If the SLN05 value is not "M4": The SLN06 element contains the CABS Usage rate and the SLN04 element contains the CABS Usage quantity. The SLN06 value must be multiplied by the SLN04 value to derive the billed amount.

Structure of Message Unit Account Level Summary:

Segment ID	Position	Segment Description	Loop	Max Use	O/M

7.2.15 SV~0800: Optional Call Plan / Discount Plan

Optional Call Plan represents charges associated with discount calling plans. Optional Call Plan charges are included in Itemized Call Detail (IT107 = 0500) for Verizon Legacy South and in Optional Call Plan/Discount Plan (IT107 = 0800) for Verizon Legacy North and expressTRAK. All are identified with an SLN loop where SLN10 = 0800. The information for Optional Call Plan is presented using HL 8, Charge Detail.

The SLN06 element contains the amount due for the Optional Call Plan. The sum of the SLN06 amounts equals the total amount for the Optional Call Plan. This amount is included in the IT104 amount.

NOTE: Additional discounts *may* appear along with Optional Call Plan charges as a separate SLN/SI loop. The SLN06 element contains the amount of the discount as a negative number and is included in the IT104 amount.

Structure of Optional Call Plan (Not Complex):

Segment ID	Position	Segment Description	Loop	Max Use	O/M
HL	010	Hierarchical Level	HL8	1	M
SLN	390	Subline item Detail	SLN	>1	M
SI	400	Service Characteristics	SLN	>1	O

Structure of Complex Services Optional Call Plan:

Complex Services Optional Call Plan is for enhanced services such as Class Services, Switch 56 KBPS, ISDN Intelligent Service, and PDN. Summaries are provided by telephone number or account number depending upon how the charges appear on the bill. The information is presented using HL 8, Charge Detail.

The SLN06 element contains the rate; SLN04 element contains the quantity. Since the SLN05 value is not "M4", the SLN06 value must be multiplied by the SLN04 value to determine the billed amount. The sum of all billed amounts (SLN06 times SLN04) is included in the IT104 amount for the appropriate service. The preceding HL 4, Group Level, indicates the type of service detail that follows. The SLN segment indicates the appropriate service and allows for verification to the correct IT104 amount.

Segment ID	Position	Segment Description	Loop	Max Use	O/M
HL	010	Hierarchical Level	HL8	1	M
SLN	390	Subline item Detail	SLN	>1	M

\$ Refer to Additional Code Lists Used by OBF/ETB (Section 10.4) for values.

7.2.16 SV~0900: Directory Assistance

Directory Assistance Service is presented as an account summary and associated subordinate line summary (ies) for each billed Directory Assistance category. The total number of billable directory assistance calls and the directory assistance billable rate are contained in the account summary. The line summaries provide a breakdown of the directory assistance calls per line and are informational in nature.

Directory Assistance charges are presented in HL 8, Charge Detail, using SLN loops. The included sub-total charges, identified by an SLN08 value of "I", can be presented by monetary amount (SLN05 = M4) or by rate and number of calls (SLN05 not equal M4).

The SLN06 element contains the Directory Assistance rate and the SLN04 element contains the Directory Assistance quantity. If the SLN05 value is not "M4", the SLN06 value must be multiplied by the SLN04 value to derive the billed amount.

The Directory Assistance Category is in the SI segment and number of calls in the QTY segment. Line Level Data is informational only and identified in the SLN loop where SLN08 value equals "O".

Structure of Directory Assistance Summary:

Segment ID	Position	Segment Description	Loop	Max Use	O/M
HL	010	Hierarchical Level	HL8	1	M
SLN	390	Subline item Detail	SLN	>1	M

7.2.17 SV~1000: WATS

WATS charges may also appear under SV~0500, depending on the billing system.

The WATS Summary is broken down into two components; Charge Detail and Line Detail. The WATS Charge detail contains rates, usage and charges. The WATS Line Detail contains tapers for hourly rates and time ranges; time and messages used and number of inward calls to 800 Service that could not complete due to a busy condition. Each WATS Service is summarized by service group and is presented using a HL 8, Charge Detail and a HL 9, Line Detail.

The SLN06 element contains the billed amount for WATS Services. The amount is included in the IT104 for WATS/800 Service (IT107 = 1000). WATS and 800 Service have the same Product/Service ID (IT107 = 1000) therefore the SLN10 element is used to indicate the type of service. This allows the user to verify the IT104 amount for the WATS Summary.

Structure of WATS:

Segment ID	Position	Segment Description	Loop	Max Use	O/M
HL	010	Hierarchical Level	HL8	1	M

7.2.18 SV~1400: Other Voice Service

Other Voice Services can include Conference Calling Charges.

The Conference Calling Chares are presented using HL 7 for grouping related detail items and HL 9 for each individual detail item. HL 7 is used to group data by from telephone line number.

The Conference Calling Charges are also presented under HL 8.

7.2.21 SV~1605: Packet Switching

Packet Switching charges are summarized by service group and are presented using a HL 8, Charge Detail. The SLN06 element contains the billed amount Data Services/Switched 56kb Services. The amount is included in the IT104 for Packet Switching (IT107 = 1820).

Structure of Packet Switching:

<i>Segment ID</i>	<i>Position</i>	<i>Segment Description</i>	<i>Loop</i>	<i>Max Use</i>	<i>O/M</i>
HL8	010	Hierarchical Level	HL8	1	M
SLN	390	Subline item Detail	SLN	1	M
PID	410	Product/Item Description	SLN	200	O

7.2.22 SV~1740: Miscellaneous

The OBF/ETB Guidelines require at least one occurrence of an HL (4) be included for each Service/Billing Provider HL (1). In some cases where there are no current charges, the Product/Service ID (IT107 = 1740) of Miscellaneous is used. In this case, the IT104 will be \$0.00.

Structure of Miscellaneous Summary:

Segment ID	Position	Segment Description	Loop	Max Use	O/M
HL	010	Hierarchical Level	HL8	1	M
IT1	210	Baseline Item Data	IT1	1	M

SAMPLE MAPPING Miscellaneous SUMMARY:

7.2.24 SV~1830: Extended Area

Extended Area charges may also appear under SV~0500, depending on the billing system.

The data for Extended Area service is provided at account summary level only. There is no line level presentation. Account Level data is presented using HL8, Charge Detail.

The SLN06 element contains the sub-total of charges by associated service code with the type of service in element SI. This amount is included in the IT104 amount for the appropriate Product/Service ID.

Structure of Extended Area:

<i>Segment ID</i>	<i>Position</i>	<i>Segment Description</i>	<i>Loop</i>	<i>Max Use</i>	<i>O/M</i>
HL	010	Hierarchical Level	HL8	1	M
SLN	390	Subline item Detail	SLN	1	M

7.2.25 SV~1990: Other Line Charge

Other Line Charge (SV~1990) is used to provide the Non-Recurring Circuit Charges and Credits on the F&E and Telemanagement Charges on Mega Audio bills. Other Line Charge are essentially the same as the Other Charges & Credits /Additions & Changes details, except the IT1 at HL4 contains 1990. See paragraph 7.2.7 for specific details of segments used and samples.

7.2.26 SV~2600: Late Payment Charges

Late Payment Charges are presented in HL 8, Charge Detail, using SLN loops. The SLN06 element contains the billed amount for Late Payment Charges. The amount is included in the IT104 for Late payment Charges (ITA107=2600).

This LPC rate may be compounded either daily or monthly. The PID segment provides the description of the compounding factor. The LPC can be calculated by multiplying the following element:

- The ITA06 element contains the LPC Rate,
- The AMT02 element of AMT~BD contains the LPC Unpaid Balance Amount
- The QTY02 element of QTY~D1 contains the number of days

Structure of Late Payment Charges:

Segment ID	Segment Position	Segment Description	Loop	Max Use	O/M
HL	010	Hierarchical Level	HL8	1	M
SLN	390	Subline Item Detail	SLN	>1	M
SI	400	Service Characteristic	SLN	>1	M

7.3 Summary/Consolidated Billing

This section, Consolidated 811 or Summary Billing arrangements, provides the structure of a Consolidated (Summary Bill Master) Account. The Consolidated or Master Account Number is used for payment. Consolidated or Summary Billing arrangements are presented differently. The Heading Section contains slightly different values and the Service Provider is only Verizon. The Detail Segments of the Consolidated Master Account are the same as those of a single account as outlined in the Detail Section 6 of this document and are not presented here. On a consolidated bill, each component (invoice point or sub-account) is represented by HL 2, Billing Arrangement, segments for the account number and HL 4, Group, with IT107-2050, segments for the invoice-point's/sub-account's total amount due. These segments are subordinate to the Verizon Service Provider HL 1.

NOTE: A Consolidated Master Account *may* incur charges and the charges will be reflected at HL 4 segments when IT107 value does not equal '2050'.

The master-account always shows the sub-account's total amount due (TDS plus BAL~P~PB plus any payments made to the sub-account plus any adjustments to the sub-account).

When a sub-account is added to a master-account, the master-account takes on financial responsibility for the previous balance of the new sub-account.

Note: Each of our billing systems handle the transfers between masters and subs differently.

7.3.1 expressTRAK Summary Billing

The master-account always shows the sub-account's total amount due (TDS plus BAL~P~PB plus any payments made to the sub-account plus any adjustments to the sub-account). In the current month's bill, the total amount due is transfers between the master-account and the sub-account -- as a result the sub-account's BAL~M~TT is zeroed out and there is not a BAL~P~PB for the next month.

7.3.3 CRIS Summary Billing

The master-account always shows the sub-account's total amount due (TDS plus BAL~P~PB plus any payments made to the sub-account plus any adjustments to the sub-account). In the next month's bill, the sub-account's previous balance is transferred between the master-account and the sub-account. The sub-account's BAL~M~TT will equal all current amounts (TDS plus adjustments to the sub-account plus payments to the sub-account) plus the previous balance minus the amount transferred between the master-account and sub-account. For existing sub-accounts, there will be a BAL~P~PB and it will be zeroed out by the transfer from the master.

CRIS EXAMPLE of an existing sub-account:

7.3.4 IX Plus Summary Billing

IX Plus has two types of master-accounts (Group Accounts):

- 1: The master-account has full financial responsibility for the sub-accounts.
- 2: The master-account has partial financial responsibility for the sub-accounts.

The balancing rules are different for these two types of master-accounts.

For IX Plus Master-Accounts, REF03 of REF~06 in the header will contain the following values to distinguish the type of balancing used by the by the IX Plus Group Account:

“1 : FULL FINANCIAL RESP”
“2 : PART FINANCIAL RESP”

7.3.4.1 IX Plus Master Account with Full Financial Responsibility

This type of IX Plus Group accounts is like a traditional summary billing arrangement. It contains a master-account and sub-accounts.

This type of IX Plus master-account can be identified by REF03 of the REF~06 Segment in the header. The REF03 element will contain:

“1 : FULL FINANCIAL RESP”

The master-account always shows the sub-account's total amount due (TDS plus BAL~P~PB plus any payments made to the sub-account plus any adjustments to the sub-account).

IX Plus sub-accounts can retain partial financial responsibility for previous balances – these are identified by a BIG07 = “PB”.

- In the sub-account, the amount retained is the amount in the BAL~M~TT.
- In the group-account, the amount retained is in an ITA at HL3 with ITA14 = “MSG” and ITA16 = “A”. Note: the amount in this ITA (IT16 = “A”) is included in balancing the TDS.

```

7.3.4.2 IX Plus Master Account with Partial Financial Responsibility

In this billing arrangement, the IX Plus group account pays for only part of the accounts in the group. The IX Plus group account is presented in the VB811 as a hybrid of summary and stand-alone billing arrangements. The group account is presented as a summary master-account that contains billing information (amounts) for sub-accounts and stand-alone-accounts. The VB811 for the group account includes the current charges for all accounts (sub-accounts and stand-alone-accounts) in the IT1 with SV~2050 and in the TDS. In the summary area, an ITA is used to remove the amount that is payable by the locations (removes the amount the group account is not financially responsible for).

This type of IX Plus master-account can be identified by REF03 of the REF~06 Segment in the header. The REF03 element will contain:

“2 : PART FINANCIAL RESP”

7.3.5 Mega Audio Summary Billing

The master-account always shows the sub-account's total amount due (TDS plus BAL~P~PB plus any payments made to the sub-account plus any adjustments to the sub-account).

The sub-account does NOT show a previous balance. The sub-account's BAL~M~TT will equal all current amounts (TDS plus adjustments to the sub-account plus payments to the sub-account).

There are no ITAs showing the transfer from the sub-account to the master-account.

7.3.6 Vision V5 Summary Billing

The master-account always shows the sub-account's total amount due (TDS plus BAL~P~PB plus any payments made to the sub-account plus any adjustments to the sub-account). In the current month's bill, the total amount due is transferred between the master-account and the sub-account -- as a result the sub-account's BAL~M~TT is zeroed out and there is not a BAL~P~PB for the next month.

Vision V5 EXAMPLE of an existing sub-account:

7.3.7 LEC NPD Accounts billed via Vision V5 Summary Billing

For LEC NPD accounts billed via Vision V5 (these are identified by the REF*06*13*V5 in the header), see paragraph 7.3.6 Vision V5 Summary Billing.

7.3.8 LEC North (NE/NY) Accounts billed via Vision V5 Summary Billing

For LEC North (NE/NY) accounts billed via Vision V5 (these are identified by the REF*06*01*V5 in the header), see paragraph 7.3.6 Vision V5 Summary Billing.

7.3.9 LEC MVD (MD, VA or DC) Accounts billed via Vision V5 Summary Billing

For LEC MVD (MD, VA or DC) accounts billed via Vision V5 (these are identified by the REF*06*01*V5 in the header), see paragraph 7.3.6 Vision V5 Summary Billing.

7.3.10 Former NBBE/EA Accounts billed via Vision V5 Summary Billing

For former NBBE/EA accounts billed via Vision V5 (these are identified by the REF*06*01*V5 in the header), see paragraph 7.3.6 Vision V5 Summary Billing.

SV~2050: Total Amount Billed (for Summary/Consolidated Billing Only)

The format for this section provides a table of segments depicting the structure of the portion of the 811 explained. After the structure table, a sample mapping for the respective area of the 811 is displayed. A comprehensive list of segments, data elements, and element values used by Verizon is provided in Appendix A of this guide.

Structure of Consolidated 811:

Segment ID	Position	Segment Description	Loop	Max Use	O/M
HL2	010	Hierarchical Level	HL2	1	M
LX	020	Sequentially Assigned Number	LX	>1	M
REF	050	Reference Numbers	LX	>1	M
HL4	010	Hierarchical Level	HL4	>1	M
IT1	210	Baseline Item Data Invoice	IT1	1	M

8. Summary Section of the EDI 811

The purpose of the Summary Section of the 811 is to provide a summary of the amount charged for services rendered. The summary section includes previous balance, total payments, detail adjustments, net adjustments and total amount due.

The format for this section provides a table of segments depicting the structure of the portion of the 811 explained. After the structure table, a sample mapping for the respective area of the 811 is displayed. A comprehensive list of segments, data elements, and element values used by Verizon is provided in Appendix A of this guide.

Structure of Summary Section:

Segment ID	Position	Segment Description	Loop	Max Use	O/M
TDS	010	Total Monetary Value Summary		1	M
ITA	020	Allowance, Charge or Service	ITA	1	O
DTM	030	Date/Time Reference	ITA	>1	O
BAL	040	Balance Detail	BAL	1	O
N1	060	Name	N1	>1	M
BAL	070	Balance Detail	N1/BAL	>1	M
DTM	080	Date/Time Reference	N1/BAL	>1	O
ITA	090	Allowance, Charge or Service	N1/ITA	>1	O
DTM	100	Date/Time Reference	N1/ITA	>1	O

DTM01	374	Date/Time Qualifier 050 = Received
DTM02	373	Date = CCYYMMDD

N1 (Name) Sample: N1~SJ~VERIZON~42~0698|

Element ID	Data Element	Element Names / Values
N101	098	Entity Identifier Code SJ = Service Provider
N102	093	Name of Service Provider
N103	066	Identification Code Qualifier 42 = Pseudo Carrier ID Code #
N104	067	Identification Code 0698= Verizon

Refer to Additional Code Lists Used by OBF/ETB (Section 10.4) for listing of Pseudo CICs.

ITA (Allowance, Charge or Service) Sample: ITA~N~TI~~04~~~1075~~~M4~~~AAJ~~O|

Element ID	Data Element	Element Names / Values
ITA01	248	Allowance or Charge Indicator N = No Allowance or Charge
ITA02	559	Agency Qualifier Code TI = Telecommunication Industry
ITA04	331	Allowance or Charge Method of Handling Code 04 = Credit Customer Account
ITA07	360	Allowance or Charge Total Amount = – 10.75
ITA11	355	Unit or Basis for Measurement Code M4 = Monetary Value
ITA14	150	Special Charge or Allowance Code AAJ = Adjustment \$
ITA16	662	Relationship Code O = Informational

\$ Refer to Additional Code Lists Used by OBF/ETB (Section 10.4) for values.

DTM (Date/Time Reference) Sample: DTM~009~19990105|

Element ID	Data Element	Element Names / Values
DTM01	374	Date/Time Qualifier 009 = Process Date
DTM02	373	Date = CCYYMMDD

LX (Assigned Number) Sample: LX~257|

Element ID	Data Element	Element Names / Values
LX01	554	Sequentially Assigned Number

REF (Reference Number) Sample: REF~PX~58000198|

Element ID	Data Element	Element Names / Values
REF01	128	Reference Number Qualifier PX = Previous Invoice Number
REF02	127	Reference Number 58000198 = Invoice Number

AMT (Monetary Amount) Sample: AMT~0S~153.23|

Element ID	Data Element	Element Names / Values
AMT01	522	Amount Qualifier Code OS = Previous Invoice Billed
AMT02	782	Monetary Amount 153.23 = Dollars/Cents

DTM (Date/Time Reference) Sample: DTM~007~20060120|

Element ID	Data Element	Element Names / Values
DTM01	374	Date/Time Qualifier 007 = Effective Date
DTM02	373	Date = CCYYMMDD

AMT (Monetary Amount) Sample: AMT~TP~150|

Element ID	Data Element	Element Names / Values
AMT01	522	Amount Qualifier Code TP = Total Amount Paid for Invoice
AMT02	782	Monetary Amount 150.00 = Dollars/Cents

DTM (Date/Time Reference) Sample: DTM~050~20060120|

Element ID	Data Element	Element Names / Values
DTM01	374	Date/Time Qualifier 050 = Received Date
DTM02	373	Date = CCYYMMDD

CTT (Transaction Totals) Sample: CTT~8|

Element ID	Data Element	Element Names / Values
CTT01	354	Number of Line Items 8 = Number of IT1 Segments

SE (Transaction Set Trailer) Sample: SE~53~0001|

Element ID	Data Element	Element Names / Values
SE01	096	Number of Included Segments = 53
SE02	329	Transaction Set Control Number = 0001

9. Auditing the EDI 811

This section describes how Verizon audits the 811. Its purpose is to assist our trading partners in the interpretation of the 811 charges and credits in a consistent manner. Before a transaction set is sent to our trading partners, Verizon balances each transaction set using the rules mapped in this section. The Heading Section does not contain any charge amounts; the Detail Section contains only current charges. The Summary Section contains total amounts. This section on auditing the 811 explains how to balance supporting detail charges/credits to the proper summary level charges/credits.

9.1 Determining Segment Amount

The following information identifies the segments from the Detail Section and Summary Section, which contribute to the total charges and credits for the invoice. For ease of reference, the term ‘segment billed amount’ is used to designate the monetary amount of the segment after:

- 1) Rule of Extended Pricing is applied: Certain segments contain both quantity and unit price data elements. The segment billed amount for these segments is the result of the quantity and the unit price. There is one exception to this general rule. If the Unit of Measurement Code (DE355) equals “M4” (Monetary Amount), then Extended Pricing does not apply and the unit price is the segment billed amount.
- 2) Verifying that the monetary amount is not provided for informational purposes only.

9.1.1 Detail Section:

AMT Segment - The AMT segment is provided for informational only and is not included in the EDI 811 Balancing.

IT1 Segment - When IT103 equals M4, then the amount in IT104 is the segment billed amount.
When IT103 does not equal M4, then the billed amount is the result of multiplying IT102 by IT104.

ITA Segment - The amount in ITA07 is the segment billed amount.
When ITA16 equals “O”, then the ITA segment is informational only.

SLN Segment - When SLN05 equals M4, then the amount in SLN06 is the segment billed amount.
When SLN05 does not equal M4, then the billed amount is the result of multiplying SLN04 by SLN06.
When SLN08 equals “O”, then the SLN segment is informational only.

TXI Segment - When TXI07 equals “A”, then TXI02 contains the segment billed amount.
When TXI07 equals “O”, then the TXI segment is informational only.

- TCD Segment-** The TCD segment has four data elements that can contain monetary amounts.
- TCD12 is the charge amount *before* any discounts
 - TCD13 is the charge amounts after any discounts.
 - TCD14 is info only and this charge amount is included in TCD12
 - TCD15 is info only and this charge amount is included in TCD12
- When TCD16 equals "O", then the TCD segment is Informational only.
- USD Segment -** When USD01 does not equal 'O', then the amount in USD08 is the segment billed amount. When USD01 equals "O", then the USD segment is informational only. When only a discount amount is provided on the USD segment, then the discount amount is populated in USD09, with the billed amount in USD08 being the same as USD09. When USD06 and USD03 are non-zero, then the billed amount in USD08 should equal the product of multiplying USD03 by USD06 When the USD segment provides a charge and discount amount, then USD08 is the net charge and USD09 is the discount amount. The charge amount before discount is calculated by adding USD09 to USD08.

9.1.2 Summary Section:

- BAL Segment** – The amount in BAL03 is the segment billed amount.
- TDS Segment** – The amount in TDS01 is the segment amount.

9.2 Auditing the Detail Section

Once the segment amount has been determined, balancing the detail section of an invoice is a three-step process. The first step of balancing is summing the supporting charges to the Charge Detail (SLN). The second step of balancing is summing the supporting charges to the Group Charges (IT1). The third step of balancing is summing supporting charges to the Total Current Month Invoice Amount (TDS).

9.2.1 8.2.1 Balancing the SLN Segment Amount

The SLN segment billed amount can be balanced by using only the segments listed and using the following formula:

Action	Element	When Condition
	USD segment billed amounts	USD01 = "I" and there is an SLN segment
Plus	TCD segment billed amounts	TCD16 = "I" and there is an SLN segment
Plus	ITA (HL 8 – 9) segment billed amounts	ITA16 = "I"
Plus	TXI (HL 8 – 9) segment billed amounts	TXI07 = "I"
Equals	SLN segment billed amount	

9.2.2 Balancing the IT1 Segment Amount

The IT1 segment billed amount can be balanced by using only the segments listed and using the following formula:

Action	Element	When Condition
	SLN segment billed amounts	SLN08 = "I"
Plus	ITA (HL 4 - 7) segment billed amounts	ITA16 = "I"
Plus	TXI (HL 4 – 7) segment billed amounts	TXI07 = "I"
Plus	ITA (HL 8 – 9) segments	ITA16 = "A"
Plus	TXI (HL 8 – 9) segment	TXI07 = "A"
Plus	USD segment billed amounts	USD01 = "I" and there is no SLN segment OR USD01 = "A" and there is an SLN segment
Plus	TCD segment billed amounts	TCD16 = "I" and there is no SLN segment OR TCD16 = "A" and there is an SLN segment
Equals	IT1 segment billed amount	

9.2.3 Balancing the TDS Segment Amount

The TDS segment billed amount can be balanced by using only the segments listed and using the following formula:

Action	Element	When Condition
	IT1 (HL 4) segments	
Plus	TXI (HL 1 – 7) segment	TXI07 = "A"
Plus	ITA (HL 1 – 7) segments	ITA16 = "A"
Plus	SLN (HL 8) segments	SLN08 = "A"
Equals	TDS segment billed amount of the Summary Section (Total Current Charges)	

9.3 Auditing the Summary Section

The summary section contains several key amounts that can be used to validate the detail charges. The TDS segment is always provided, with ITA and BAL segments only provided when the applicable amount is *not* equal to zero. Below is a summary of what information is contained in each segment:

- ◆ The TDS segment provides charges for the current bill period.
- ◆ The ITA segment provides charges/credits related to refund checks or amounts transferred to/from another account.
- ◆ BAL segment with a value of “PB” in BAL 02 normally provides the amount billed the previous month.

Notes:

1. IBRS, SingleView and Vision invoices include a Statement of Account section and their invoice provides the total past due after applying any payments and/or adjustments. For these billing systems, the VB 811 BAL “PB” reflects the total past due after applying any payments and/or adjustments. For these systems the payments and adjustments can be found in the Statement of Account section of the invoice. The VB811 presents the Statement of Account in the LX loop within the N1 loop in the summary area.
 2. GCS and Millennium invoices do not provide information on previous balances, payments or adjustments against previous balances.
- ◆ BAL segment with a value of “NA” in BAL 02 provides the net adjustment amount for the entire bill (See notes under BAL PB)
 - ◆ BAL segment with a value of “TP” in BAL 02 provides the total payment amount applied since the last bill. (See notes under BAL PB)
 - ◆ BAL segment with a value of “TT” in BAL 02 provides the amount due on the account.

9.3.1 Balancing to the Total Transaction Amount “TT” Segment Amount

The Total Transaction (BAL 02 = TT) can be balanced by summing the following segment billed amounts:

Note that the BAL and ITA segments in the N1 loop are informational only and do not impact the calculation of the Total Transaction.

Action	Element	When Condition
	TDS01	
Plus	ITA	ITA16 = “A”
Plus	BAL	BAL02 = “PB”
Plus	BAL	BAL02 = “NA”
Plus	BAL	BAL02 = “TP”
Equals	Total Transaction Amount	BAL02 = “TT”

9.3.2 Balancing to the Service Provider Net Adjustment

The summary Section also contains multiple N1 loops, which will reflect any adjustments for any Service Provider. These adjustments (ITA segments) are not added into the TDS amount but can be validated with the value in the BAL02 'NA' segment. The net adjustment $BAL02 = "NA"$ can be determined by summing all ITA (where ITA14 = "ADJ")) segment amounts within the N1/ITA loop in the Summary Area.

End
